

Abstract

A dust-collection container (11) for a hand-held power tool with a dust-extraction device is indicated that has a container wall that encloses a dust-collection volume and a dust-intake opening (19) for connection to a dust-discharge adapter of hand-held power tools. To ensure timely emptying of the full dust-collection container (11) when working with the hand-held power tool, a viewing window (21) is provided in the container wall, through which the dust fill level can be visually determined (Figure 3).
